The author:

MICHAEL KEMPKES, born in 1971 in Bocholt, Germany.

Fascinated by guppies since childhood, he joined the German Guppy Federation in 1986. In early years, KEMPKES received numerous awards at guppy exhibitions, e.g. the Championship title of the former European Guppy Association in 1996. In the 1990s the author focussed on the biology of guppies. Expeditions led him to the natural habitats of the guppies. In his 70 aquariums KEMPKES investigated the genetics, reproduction and behavioural biology of guppies, which resulted in numerous articles and books.

Description:

The live-bearing guppies are the most popular freshwater aquarium fish species in the world. Due to their striking colours, big fins, and other fascinating attributes, countless ambitious aquarists and biologists deal with these living jewels. During the last 30 years, important scientific findings on ecology, evolution, reproduction, genetics, and behaviour have been published. Guppy breeders, too, are diligent observers and excellent experts of *Poecilia reticulata*, *Poecilia wingei*, and *Poecilia obscura*.

In this new two-volume standard book MICHAEL KEMPKES bridges fishkeeping and science by describing the findings of both aquarists and biologists. He presents a unique and comprehensive monograph which depicts the current knowledge about the biology of guppies. The guppy breeder will find extensive information which allow deeper insights into the biological features of these remarkable fish species and an improvement of guppy keeping and breeding. LANGUAGE: German.
